RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 90 pages. Original publisher: Washington, D. C. : National Telecommunications and Information Administration, 2010 OCLC Number: (OCoLC)671751259 Subject: Radio -- Interference. Excerpt: . . . EXECUTIVE SUMMARY This report describes the results of radiated emission measurements on a radio-service denial device (called a jammer). The manufacturer temporarily provided the device to the National Telecommunications and Information Administration (NTIA) Institute for Telecommunication Sciences (ITS) Boulder laboratory for the purpose of such measurements. The device is designed to jam communication services in the 869-894 MHz (cellular) and 1930-1990 MHz (PCS) radio bands. Please note that the device does not carry any Federal Communications Commission (FCC) certification and its design and parts are idiosyncratic to the manufacturer. NTIA performed the measurements mostly via radiated emissions in a National Institute of Standards and Technology (NIST) radio-anechoic chamber. NTIA measured the devices emissions in both the frequency and time domains. NTIA performed spectrum measurements from 100 MHz to 6 GHz. This allowed the devices emissions to be measured up to the sixth harmonic of its lower-band (cellular band) emissions and up to the third harmonic of its upper-band (PCS band) emissions. NTIA also performed especially detailed measurements in selected Federal and non-Federal frequency bands. The jammer transmitter operates by repetitively frequency-sweeping (called chirping) a carrier wave (CW) signal across the bands that are to be jammed. The transmitter essentially consists of a parallel pair of power supplies, amplifier controllers, high-power amplifiers, and outputs; the construction is parallel for the two jammer bands. An external radiofrequency (RF) signal combiner is normally installed at the output so that a single RF...
